Conclusion

- What are problems associated with reproducibility?
- What are solutions to these problems?
- What are practical tools to implement these solutions?

Science advances by building on the work of others.

*If I have seen further, it is by standing on the
shoulders of giants*

—Sir Isaac Newton, 1676

What prevents us from building on others' work?

- Data not shared
- Analysis not shared
- Methods/protocol not shared

What enables us to build on others' work?

- Data shared in trusted public repository
- Code/Analysis shared in trusted public repository
- Methods/protocol follow appropriate reporting standard
- Also: findings/scholarly publications available (open access)

Conclusion

Make sure you report everything another researcher would need to replicate your research, including the exact methods.

What to report (following medicine):

- Find the appropriate reporting standard for your field and follow it.
- Enhancing the QUALity and Transparency Of health Research (EQUATOR Network)
- The most widely-adopted standard: Consolidated Standards of Reporting Trials (CONSORT).
- Standard Protocol Items: Recommendations for Interventional Trials (SPIRIT Statement).
- Transparency and Openness Promotion (TOP)
Guidelines: <http://cos.io/top>

History in Economics:

- Journal of Money Credit and Banking Project: Dewald, Thursby, Anderson *AER* 1986.
 - Low response rate to requests to share data.
 - Attempted to reproduce 9 papers, problems with all (some minor) even with help of original authors.

Replication in Empirical Economics: *The Journal of Money, Credit and Banking Project*

By WILLIAM G. DEWALD, JERRY G. THURSBY, AND RICHARD G. ANDERSON*

This paper examines the role of replication in empirical economic research. It presents the findings of a two-year study that collected programs and data from authors and attempted to replicate their published results. Our research provides new and important information about the extent and causes of failures to replicate published results in economics. Our findings suggest that inadvertent errors in published empirical articles are a commonplace rather than a rare occurrence.

TABLE 1—RESPONSES TO REQUESTS FOR DATA FROM AUTHORS OF EMPIRICAL PAPERS^a

	Published before Data Requested	Accepted before Data Requested	Under Review when Data Requested
Requests	62	27	65
Responses	42	26	49
Response Rate (Percent)	66	96	75
Mean Response Time (Days)	217	125	130
Not Submitted:			
Confidential Data	2	1 ^b	0
Lost or Destroyed Data	14	2	1
Data Available, But Not Sent ^c	4	2	1
Nonrespondents	20	1	16
Total Not Submitted	40	6	18
Nonsubmission Rate (Percent)	66	22	28

^aIncludes all requests made through December 1984, and excludes authors whose papers were rejected.

^bTwo data sets were partially confidential.

^cThis category includes authors who (i) stated that their data were available from published sources, but did not send their data; and (ii) authors who claimed to have their data but were unwilling to sort through their papers to find the data.

Why share your data in a trusted public repository?

- Find the appropriate repository:
<http://www.re3data.org/>
- Repositories will last longer than your own website.
- Repositories are more easily searchable by other researchers.
- Repositories will store your data in a non-proprietary format that won't become obsolete.
- Repositories manage meta-data better.
- Repositories create digital citable identifiers (DOI).

Examples of Trusted Repositories:

- Harvard's Dataverse
- Data Dryad
- figshare
- Open Science Framework
- Check the journal—they may use one of these
 - *REStat's* Dataverse

Data Sharing

Replication

Conclusion

- One of the longest run repositories, institutional member setup.
- New: OpenICPSR

- With data available, we can begin to replicate studies.
- We should be very careful about what we mean by “replication.”
- “The Meaning of Failed Replications” Michael Clemens, CGD Working Paper 399.

Table 1: A PROPOSED DEFINITION TO DISTINGUISH REPLICATION AND ROBUSTNESS TESTS

	Sampling distribution for parameter estimates	Sufficient conditions for discrepancy	Types	Methods in follow-up study versus methods <i>reported</i> in original:			Examples
				Same specification	Same population	Same sample	
Replication	<i>Same</i>	<i>Random chance, error, or fraud</i>	Verification	<i>Yes</i>	<i>Yes</i>	<i>Yes</i>	<i>Fix faulty measurement, code, dataset</i>
			Reproduction	<i>Yes</i>	<i>Yes</i>	<i>No</i>	<i>Remedy sampling error; low power</i>
Robustness	<i>Different</i>	<i>Sampling distribution has changed</i>	Reanalysis	<i>No</i>	<i>Yes</i>	<i>Yes/No</i>	<i>Alter specification, recode variables</i>
			Extension	<i>Yes</i>	<i>No</i>	<i>No</i>	<i>Alter place or time; drop outliers</i>

The “same” specification, population, or sample means the same as *reported* in the original paper, not necessarily what was contained in the code and data used by the original paper. Thus for example if code used in the original paper contains an error such that it does not run exactly the regressions that the original paper said it does, new code that fixes the error is nevertheless using the “same” specifications (as described in the paper).

- For science in general:

- For you as researchers:

Why Replicate? Motivation and suggestions from Nicole Janz of Political Science Replication and Cambridge University

- For science in general:
 - Uncover misconduct and sloppy science
 - Confirm previous findings and generalizability
 - Point to misuse of statistical methods
- For you as researchers:
 - Learn statistics
 - Jump to research frontier
 - Publish
 - Make your own research routinely reproducible
 - Fun

Which study should you pick to replicate?

- Don't select a study with methods that you don't know or can't learn within a reasonable time.
- Pick a recent study (<5 yo) from a good journal.
- Data (and code) should be publicly available.
- The journal that published the original study has published replications before.

Which journals publish replications?

- List from The Replication Network study, Duvendack et al.
- Sadly fairly limited in economics (10).
- Selected journals from Janz (2015)

TABLE 2. Journals whose websites explicitly mention that they publish replications

1)	<i>Econ Journal Watch</i>
2)	<i>Economic Development and Cultural Change</i>
3)	<i>Economics of Education Review</i>
4)	<i>Empirical Economics</i>
5)	<i>Experimental Economics</i>
6)	<i>Explorations in Economic History</i>

- * original study was published in the same journal
- + home of the original 'Many Labs' project
- # special issue dedicated to replications (March 2015)
- ^ this journal invites replication studies

How exactly to replicate?

- Be systematic: write a pre-analysis plan.
- Don't just go on a fishing expedition. We all know that if you dig hard enough, you can find a specification that makes results appear weaker. Don't selectively report those specifications.
- Be courteous and professional.
- Take an entirely systematic approach:
 - Many Labs Project
 - Crowdsource your analysis

Team	Analytic Approach	OR
12	Zero-inflated Poisson regression	0.89

ONE DATA SET, MANY ANALYSTS

Twenty-nine research teams reached a wide variety of conclusions using different methods on the same data set to answer the same question (about football players' skin colour and red cards).

Dark-skinned players four times more likely than light-skinned players to be given a red card.

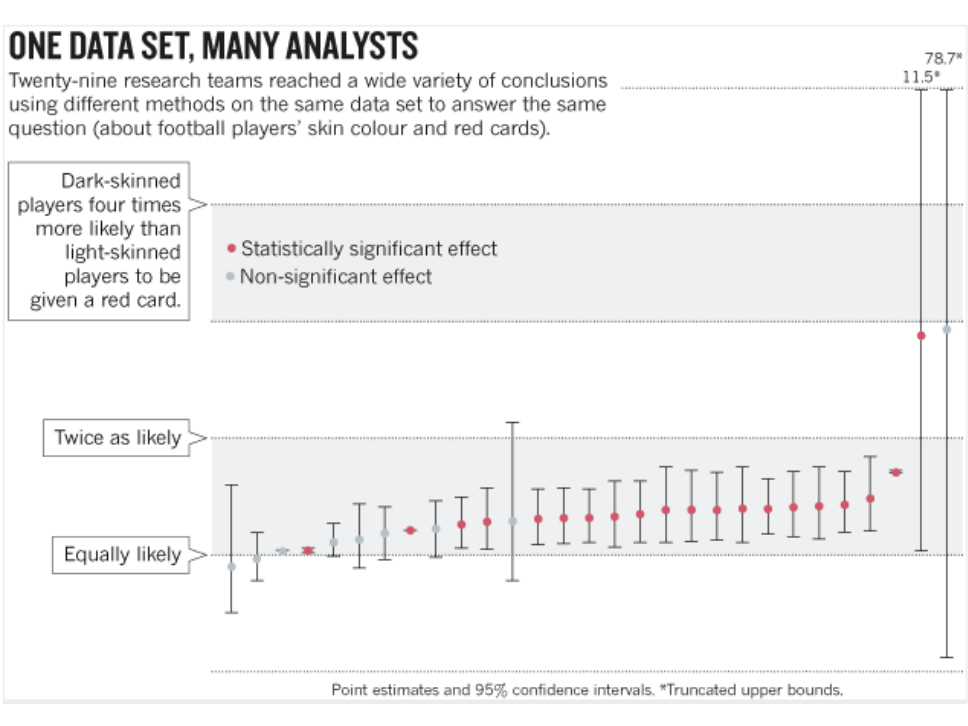

- Statistically significant effect
- Non-significant effect

Twice as likely

Equally likely

78.7*
11.5*

Point estimates and 95% confidence intervals. *Truncated upper bounds.

Another social science looks at itself

Experimental economists have joined the reproducibility discussion by replicating selected published experiments from two top-tier journals in economics. Camerer *et al.* found that two-thirds of the 18 studies examined yielded replicable estimates of effect size and direction. This proportion is somewhat lower than unaffiliated experts were willing to bet in an associated prediction market, but roughly in line with expectations from sample sizes and P values.

Science, this issue p. 1433

Abstract

The replicability of some scientific findings has recently been called into question. To contribute data about replicability in economics, we replicated 18 studies published in the *American Economic Review* and the *Quarterly Journal of Economics* between 2011 and 2014. All of these replications followed predefined analysis plans that were made publicly available beforehand, and they all have a statistical power of at least 90% to detect the original effect size at the 5% significance level. We found a significant effect in the same direction as in the original study for 11 replications (61%); on average, the replicated effect size is 66% of the original. The replicability rate varies between 67% and 78% for four additional replicability indicators, including a prediction market measure of peer beliefs.

An economics study featuring a performance by Robin Williams failed to replicate after the actor's death.
